PATIENT: JUNG, JOONG HUN
DATE OF BIRTH: 07/12/1962
PHONE: 646-965-0799
DATE OF STUDY: 12/12/2019
MEDICAL RECORD #: 256217
ORDER # A749959

PROCEDURE: MRI OF RIGHT SHOULDER

INDICATION: Right shoulder pain.

COMPARISON: None.

TECHNIQUE: MR imaging of the right shoulder was obtained by using 1.5 T high field strength unit in coronal T1 weighted, coronal IR, sagittal T2 weighted and axial PD sequences fat suppressed sequences.

FINDINGS: The acromioclavicular joint demonstrates mild expansion of the capsular ligaments. There is the inferior sloping of the peripheral margin of the anterior acromion. The patient has a type I acromial process. The bone marrow signal intensity is unremarkable. The lateral aspect of the humeral head demonstrates a focal subcortical edema. The bony alignment is anatomic. The glenohumeral joint space is preserved.

The supraspinatus tendon demonstrates an interstitial tear. The subscapularis tendon demonstrates an interstitial tear. The remaining of the rotator cuff and the long head of the biceps tendon are intact. The bicipital tendon sheath demonstrates a small fluid signal intensity compatible with tenosynovitis.

Mild edema is noted in the subacromial-subdeltoid, subscapular, and subcoracoid bursae consistent with bursitis. The posterosuperior labrum demonstrates a tear.

IMPRESSION:

Focal subcortical edema in the humeral head may relate to the injury.

Interstitial tear in the supraspinatus tendon.

Interstitial tear in the subscapularis tendon.

Bicipital tenosynovitis.

Posterosuperior labral tear/SLAP tear.

Periarticular bursitis.

Approved Electronically: Hu, Mary MD 12/13/2019 04:40 PM
