Re: Soon J. Park
DOB: 04/19/1945

Dear Dr. Clarke:

It was a pleasure seeing your patient in my Flushing office today.

The patient is a 74-year-old woman, who was the restrained driver of a vehicle that was involved in a motor vehicle accident on 08/05/2019. I had seen her on 12/18/2019 on an initial visit. She had continued pain in her right shoulder and right knee. At that time, the patient was advised to undergo right shoulder and right knee arthroscopic surgeries. She was also advised to continue with physical therapy.

Today, the patient is status post right knee arthroscopic surgery performed on 01/10/2020.

On physical examination, the patient is an alert, oriented and cooperative lady. The surgical site is well healed. She has regained full mobility of the right knee. There is no evidence of infection or any problem with the right knee surgery; however, incidentally, she has developed infrapatellar bursitis at the insertion of sartorius tendon which is not related to the surgery. It is a coincidental finding.

FINAL DIAGNOSIS: Status post right knee arthroscopic surgery on 01/20/2020.

TREATMENT/PLAN:

I have reassured the patient in the best possible way I could. I have referred this patient to a pain management specialist for possible injection of cortisone at the insertion of the sartorius tendon in the infrapatellar area.

In the meantime, the patient was advised to continue with physical therapy and ice packs. Application of ultrasound could help her as well. The patient was instructed to return to my office if she has any problems.
